

Assignment - 3 CA-Software

Trends & Cloud Services Overview &

27 Serverless Architecture:

Serverless platforms (e.g., AWS Lambda, Azure Functions) let developers deploy code without managing servers. They auto-scale with demand, reduce idle costs & accelerate development by handling infrastructure behind the scenes.

27 Progressive Web Apps (PWAs):-

PWAs offer a mobile-app-like experience using web technologies (HTML, CSS, JS). They are responsive, work offline, support push notifications & can be installed on devices - making them a cost effective alternative to native apps.

37 AI & ML in Software Architecture:-

AI/ML enhance software with features like recommendations, automations, & real-time analytics. They personalize user experiences & improve operations in areas like fraud detection & customer service.

Cloud Computing Service Models:

- SaaS: Software delivered via the internet (e.g., Google Workspace), with no installation required.
- PaaS: Platforms for building & deploying apps without managing infrastructure (e.g., Heroku).
- IaaS: On demand access to virtualized hardware resources (e.g., AWS, Azure), offering full control over infrastructure.
